Made with [MyST](#) and [Typst](#) using the [JBOSSTypst template](#).

Abstract

This thesis investigates how to keep document metadata and front matter as a single source of truth shared by MyST and Typst export pipelines. The goal is to let students write their content once while still producing a well-structured thesis PDF with minimal manual formatting. Particular attention is given to the boundary between semantic metadata in MyST and layout-specific decisions in Typst, so that the template remains flexible without becoming confusing to maintain. The resulting workflow aims to be readable, robust for incomplete drafts, and easy to extend with institution-specific front matter when needed.

Keywords: myst, typst, thesis template, front matter, metadata mapping, academic writing workflow, document automation

Acknowledgements

I thank my supervisors, committee members, and peers for their guidance and feedback during this thesis project.

1. Introduction

In a usual thesis, this chapter introduces the research problem, objectives, and thesis outline. It provides background information on the topic and sets the stage for the subsequent chapters. The introduction also highlights the significance of the research and its potential contributions to the field.

For this project, we provide background on the project and this specific template. We explore the utilization of Jupyter Book 2 and the MyST Document Stack as a modular, extensible, web-native stack for authoring and publishing computational narratives Bolyen et al. (2025). Our project aims to investigate the capabilities and benefits of using JupyterBook for the publication of bachelor and master thesis.

1.1 Subsection

In recent years, there has been a growing interest in [insert research topic]. This is due to [insert reasons for interest]. Despite the increasing attention, there are still gaps in the existing literature that need to be addressed. This research aims to fill those gaps by [insert research objectives].

Figure 1.1: The Jupyter Book project allows to convert the sourcefiles in different outputs using the Abstract Syntax Tree.

1.1.1 Subsubsection

We can make subsubsection which are not, by default, in the ToC unless you override the ToC depth in the export file!

1.2 Research Problem

The main research problem addressed in this thesis is [insert research problem]. This problem is significant because [insert reasons for significance]. Addressing this problem will contribute to a better understanding of [insert related field or topic].

Here is an equation:

$$F = m \cdot a \tag{1.1}$$

2. Background

This chapter summarizes related work and the conceptual foundations of the study.

At Delft University of Technology (TUD), people started using Jupyter Book to create open educational resources mainly in the form of [online educational textbooks](#). Various initiatives were taken to lower the technical barrier for educators to create and share their own resources, see for example [Teachbooks](#).

With the introduction of Jupyter Book 2, the opportunity arose to create scientific content (e.g., research articles, theses, reports) in addition to educational content. As new technologies are adopted when the benefits are clear and the barriers are low, we applied for the [TUD's Open Science Fund](#) to explore a seemingly effortless workflow with Jupyter Book for open publishing scientific content. This grant was awarded in October 2025.

This template is one of the result of this project. We aim to help (TU Delft) students, researchers and educators to create, publish, and share open educational and scientific resources with Jupyter Book. The [project's guide](#) covers the entire workflow from installation, content creation, and customization to publishing and sharing.

3. Methods

This chapter describes the methodology, implementation approach, and evaluation setup.

Figure 3.2: Here a setup.

4. Results

This chapter presents the experimental results and key observations.

$$F = m \cdot \frac{dv}{dt} \tag{4.1}$$

Using a labeled equation, `$$ F = m \cdot \frac{dv}{dt} $$ (eq:newton2)` we can refer to that equation like: [eq 1](#). In your `myst.yml` you can specify the numbering, see the [documentation](#).

5. Conclusion

This chapter concludes the thesis and outlines future work.

5.1 Future work

We will continuously work on the JBOSS project and improve the template based on user's input.

6. Appendix A: Extra Data

Supporting tables, figures, or additional analyses can be included here.

7. Appendix B: Supplement

Additional implementation details and supplementary material can be added here.
