Made with [MyST](#) and [Typst](#) using the [JBOSSTypst template](#).

Abstract

This thesis investigates how to keep document metadata and front matter as a single source of truth shared by MyST and Typst export pipelines. The goal is to let students write their content once while still producing a well-structured thesis PDF with minimal manual formatting. Particular attention is given to the boundary between semantic metadata in MyST and layout-specific decisions in Typst, so that the template remains flexible without becoming confusing to maintain. The resulting workflow aims to be readable, robust for incomplete drafts, and easy to extend with institution-specific front matter when needed.

Keywords: myst, typst, thesis template, front matter, metadata mapping, academic writing workflow, document automation

Acknowledgements

I thank my supervisors, committee members, and peers for their guidance and feedback during this thesis project.

1. Introduction

This chapter introduces the research problem, objectives, and thesis outline. It provides background information on the topic and sets the stage for the subsequent chapters. The introduction also highlights the significance of the research and its potential contributions to the field.

It explores the utilization of Jupyter Book 2 and the MyST Document Stack as a modular, extensible, web-native stack for authoring and publishing computational narratives Bolyen et al. (2025). The research aims to investigate the capabilities and benefits of this stack in enhancing the authoring and publishing process for computational narratives.

1.1 Subsection

In recent years, there has been a growing interest in [insert research topic]. This is due to [insert reasons for interest]. Despite the increasing attention, there are still gaps in the existing literature that need to be addressed. This research aims to fill those gaps by [insert research objectives].

Figure 1.1: A basic setup of an experiment

1.1.1 Subsubsection

We can make subsubsection which are not, by default, in the ToC unless you override the ToC depth in the export file!

1.2 Research Problem

The main research problem addressed in this thesis is [insert research problem]. This problem is significant because [insert reasons for significance]. Addressing this problem will contribute to a better understanding of [insert related field or topic].

Here is an equation:

$$F = m \cdot a \tag{1.1}$$

2. Background

This chapter summarizes related work and the conceptual foundations of the study.

Here some text on open education and open science.

3. Methods

This chapter describes the methodology, implementation approach, and evaluation setup.

4. Results

This chapter presents the experimental results and key observations.

$$F = m \cdot \frac{dv}{dt} \tag{4.1}$$

Using a labeled equation, `$$ F = m \cdot \frac{dv}{dt} $$ (eq:newton2)` we can refer to that equation like: [eq 1](#). In your `myst.yml` you can specify the numbering, see the [documentation](#).

5. Conclusion

This chapter concludes the thesis and outlines future work.

5.1 Future work

We will continuously work on the JBOSS project and improve the template based on user's input.

6. Appendix A: Extra Data

Supporting tables, figures, or additional analyses can be included here.

7. Appendix B: Supplement

Additional implementation details and supplementary material can be added here.
